STRUCTURE TYPE: CANOPY
SCOPE: PUBLIC REALM
SIZE: APPROX. 900 SF
HEIGHT: APPROX. 14'
WIDTH: APPROX. 46'
STRUCTURE: STEEL
ROOF: PTFE MEMBRANE

PTFE (Polytetrafluoroethylene) roof membrane is a high-performance, durable material used in roofing systems, particularly in architectural applications. PTFE is a synthetic fluoropolymer with properties that make it ideal for use in building canopies.

High Durability: PTFE is resistant to UV radiation, chemicals, and temperature extremes, which makes it highly durable and suitable for outdoor applications.

Low Friction: PTFE is known for its non-stick properties, similar to Teflon, which prevents dirt and debris from adhering to the membrane, leading to easier maintenance and longer-lasting cleanliness.

Lightweight: PTFE roof membranes are lightweight compared to traditional roofing materials like concrete or metal, reducing the load on the structural framework of the building.

Flexibility: PTFE membranes are flexible and can be used to create unique and complex architectural forms, making them popular for modern design and large-span roofs, such as stadiums and airports.

Translucency: PTFE can allow some light to pass through, which can be advantageous in creating bright, naturally lit spaces beneath the roof.

Longevity: These membranes are long-lasting and can perform effectively for decades with minimal degradation.

Due to these properties, PTFE membranes are often used in tension structures, canopies, and other specialized roofing systems where aesthetics, performance, and durability are critical.
